

Final Year Project Evaluation System

(Fall 2021-Spring 2025)

ABSTRACTS

- A robust web platform providing dedicated panels for students, faculty, and administrators, enabling seamless online submissions, an interactive discussion forum, timely updates on announcements, and an integrated system for evaluation and feedback.

ARCHITECTURE

- The FYP Evaluation System is built using a modular architecture with three primary panels (Student, Faculty, and Admin). It follows a client-server model:
- **Frontend:** Built with React for a dynamic and responsive interface.
- **Backend:** MongoDB and Firebase serve as the backend, providing authentication, database, and storage services.
- **Data Flow:** User interactions are managed through REST APIs, ensuring secure and efficient communication.
- **Security:** Role-based access control restricts access to features based on user roles.
- **Scalability:** The architecture is designed for scalability, allowing for the addition of new features without significant redesign.

TOOLS & TECHNOLOGIES

- React, Node.js, MongoDB, Firebase.
